#### RESEARCH IN THE FOUNDATION LABORATORY

There has long been, with me, a deep conviction that whatever the Foundation achieves over a period of time the final verdict will name our scientific success as having moved the healing art into the electronic age. Electronics will have become the primary tool of the healing practitioner. In order to make this graphically clear, let's assume that this achievement constitutes a development of three pieces of electronic equipment namely the DIAGNOSTIC ANALYZER, the ORIC FIELD PENETRATOR and the ELECTRONIC CHARGER.

First, let me say that the DIAGNOSTIC ANALYZER will function by scanning the human oric field, being a sensitive instrument somewhat similar to the remote control hand device used with our

television and VCR sets. This instrument, through its sensors, will absorb and record the currents within the oric field and register them on a graph. This picture will be shown on a large screen that will outline the human form, completely revealing the state of health in the force field measurements. Every inharmony will be indicated on the screen.

Having thus determined the state of health of the patient, the physician then turns to the second piece of equipment known as the ORIC FIELD PENETRATER. This device will beam a force field ray to the area in need of balancing. As this electronic beam is administered, healing will take place in the oric or electromagnetic field of the patient's body. At this point, total healing will have been achieved.

Finally, the physician will administer a preventative treatment for the well being of the patient through the use of a third piece of equipment known as the ELECTRONIC CHARGER. This instrument will literally withdraw from the atmosphere atomic energy particles and redirect them to the person being treated.

This will assure the continued good health of the patient by balancing the physical, emotional, mental and spiritual bodies of the patient.

To hard science this scenario is nothing more than scientific fiction and probably with good reason. A multiplicity of disciplines over decades of time would have to be brought into play even to perfect a part of such a puzzle.

This leads me precisely to the necessity of having our laboratory, where the approach to the development of such equipment can be privately undertaken not only through the use of hard science, but also by minds which are inspired by the voice of divinity within. Here lies navigation in uncharted seas. I am convinced that inspired thought and direction are available to one who dares to put himself in touch with the wisdom available from higher sources. I believe there are many willing listeners including an Edison or an Einstein hidden from normal view awaiting to be brought into manifestation. Many conventional

laboratories are manned by young scientists awaiting the inspiration of a guiding hand.

A quiet focusing in this direction will result in a herculean leap ahead in the inertia of the time table and bring forth a development in the century ahead that will pale what we have seen in this century.

This is an attempt to graphically illustrate what I have been putting before you from time to time. This goal is one which I feel should be undertaken as a definite program of the Foundation. If we make the start, in time there will be a cleansing of the scientific attitude and human kind will ultimately receive the benefit of blessings which are due to come.

MEMORANDUM

DATE: March 15, 1989

TO: Orest Bedrij; Janis Claflin; Robert Jahn; Glenn Olds;  
Judith Whitson; Maurice Strong

FROM: John E. Fetzer

RE: Research In The John E. Fetzer Foundation Laboratory

In the establishment of a small laboratory in the Foundation, I believe it is appropriate to define the type of APPLIED research to be undertaken. This would include the testing of devices devoted to healing. Some such devices would be existing equipment such as the BIOFIELD SPECTRUM ANALYZER, the

MULTI-DIMENSIONAL RESONATOR and the so called SUPER PRO RESONATOR. These represent a multiplicity of such devices that are now readily available. Many devices are devoted to scanning the human oric field. Others are dealing with force field to effectuate balancing. This type of APPLIED research would attempt to show the efficacy of the process and is illustrative of that which would be undertaken in our Pioneer program. This more particularly is an attempt to further describe the process in my memorandum of January 9th, 1989.

Memorandum from John E. Fetzer

Page 2

It should be emphasized that basic research is not the function of this private laboratory of the Foundation. That belongs to the highly professional research such as is done at Princeton, the Menninger Foundation and elsewhere. In the election of a person to lead such research, all members of the Trustees that wish to participate should be extended that opportunity.
